

Week 10: Temporal data

25/03/23

Child mortality in Sri Lanka

In this lab you will be fitting a couple of different models to the data about child mortality in Sri Lanka, which was used in the lecture. Here's the data and the plot from the lecture:

Fitting a linear model

Let's firstly fit a linear model in time to these data. Here's the code to do this:

Linear fit shown in black

Question 1

Project the linear model above out to 2023 by adding a **generated quantities** block in Stan (do the projections based on the expected value μ). Plot the resulting projections on a graph similar to that above.

```
Running /Library/Frameworks/R.framework/Resources/bin/R CMD SHLIB foo.c
clang -mmacosx-version-min=10.13 -I"/Library/Frameworks/R.framework/Resources/include" -DNDEBUG
In file included from <built-in>:1:
In file included from /Library/Frameworks/R.framework/Versions/4.2/Resources/library/StanHeaders/include/Standalone/StanHeaders.h:1:
In file included from /Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen/include/RcppEigen.h:1:
In file included from /Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen/include/Eigen/src/Core/Matrix.h:1:
/Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen/include/Eigen/src/Core/Matrix.h:1:10: fatal error: 'Eigen/Core' file not found
namespace Eigen {
^
/Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen/include/Eigen/src/Core/Matrix.h:1:10: fatal error: 'Eigen/Core' file not found
namespace Eigen {
^

In file included from /Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen/include/RcppEigen.h:1:
/Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen/include/Eigen/Core:1:10: fatal error: 'Eigen/Core' file not found
```

```
#include <complex>
      ^~~~~~
```

```
3 errors generated.
```

```
make: *** [foo.o] Error 1
```

Ratio of neonatal to other child mortality (logged), Sri Lanka
Linear fit shown in black, Projection shown in red

Random walks

Question 2

Code up and estimate a first order random walk model to fit to the Sri Lankan data, taking into account measurement error, and project out to 2023.

```
Running /Library/Frameworks/R.framework/Resources/bin/R CMD SHLIB foo.c
clang -mmacosx-version-min=10.13 -I"/Library/Frameworks/R.framework/Resources/include" -DNDEBUG
In file included from <built-in>:1:
In file included from /Library/Frameworks/R.framework/Versions/4.2/Resources/library/StanHeaders/include/stan/math/
In file included from /Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen/include/Eigen/Core:1:
In file included from /Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen/include/Eigen/Geometry:1:
/Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen/include/Eigen/src/Geometry/AlignedBox.h:1:
namespace Eigen {
~
/Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen/include/Eigen/src/Geometry/AlignedBox.h:1:
~
```

```

namespace Eigen {
    ^
    ;
In file included from <built-in>:1:
In file included from /Library/Frameworks/R.framework/Versions/4.2/Resources/library/StanHead:
In file included from /Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen:
/Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen/include/Eigen/Core:
#include <complex>
    ^~~~~~
3 errors generated.
make: *** [foo.o] Error 1

```

Question 3

Now alter your model above to estimate and project a second-order random walk model (RW2).

```

Running /Library/Frameworks/R.framework/Resources/bin/R CMD SHLIB foo.c
clang -mmacosx-version-min=10.13 -I"/Library/Frameworks/R.framework/Resources/include" -DNDEBUG
In file included from <built-in>:1:
In file included from /Library/Frameworks/R.framework/Versions/4.2/Resources/library/StanHead:
In file included from /Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen:

```

```

In file included from /Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen
/Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen/include/Eigen/src/C
namespace Eigen {
^
/Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen/include/Eigen/src/C
namespace Eigen {
^
;
In file included from <built-in>:1:
In file included from /Library/Frameworks/R.framework/Versions/4.2/Resources/library/StanHead
In file included from /Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen
/Library/Frameworks/R.framework/Versions/4.2/Resources/library/RcppEigen/include/Eigen/Core:
#include <complex>
      ^~~~~~
3 errors generated.
make: *** [foo.o] Error 1

```

Question 4

Run the first order and second order random walk models, including projections out to 2023. Compare these estimates with the linear fit by plotting everything on the same graph.

Ratio of neonatal to other child mortality (logged), Sri Lanka
 Linear fit shown in black, First order random walk in red, Second order random walk in blue

The following only plots point estimates.

Ratio of neonatal to other child mortality (logged), Sri Lanka
 Linear fit shown in black, First order random walk in red, Second order random walk in blue

Question 5

Rerun the RW2 model excluding the VR data. Briefly comment on the differences between the two data situations.

Ratio of neonatal to other child mortality (logged), Sri Lanka

Second order random walk fit in black, Projection in red

Question 6

Briefly comment on which model you think is most appropriate, or an alternative model that would be more appropriate in this context.

Answer

The linear model is not appropriate since it does not capture the downward trend observed in the latest observations.

The first order random walk seems to be over-fitted to the data (fitted curve is less smooth) and the projection does not capture the downward trend either.

Now we compare the two second order random walk models. Let's put these two second order random walk models into one graph to compare.

Ratio of neonatal to other child mortality (logged), Sri Lanka
Model with VR in blue, without VR in red

The following graph only shows fits, i.e. projections removed:

Ratio of neonatal to other child mortality (logged), Sri Lanka
Model with VR in blue, without VR in red

We consider the second walk random walk without VR is most appropriate for two reasons. First, the projection is narrower than that with VR data. Second, point estimates looks much smoother than with VR data.

It seems that the difference between these two comes from overfitting to the data with VR. Because the first model tries to fit all observations including the VR data, we observed wider variance in the projection as a trade off for it.
